

Centralized and Secure Access Portal

Lighthouse is a software solution designed to simplify network management. It serves as the foundation for Opengear's Network Resilience Platform, providing a unified management framework.

Network professionals, system administrators, and IT support teams use Lighthouse to deploy, manage and fix Opengear appliances, as well as other physical and virtual connected resources. The API provides access to configuration entities.

Lighthouse Enhances the Opengear Solution

Lighthouse delivers simplified deployment, streamlined management, and expedited access for network professionals who want to manage their out-of-band network effortlessly.

Unlike manual methods, which can cause data-integrity and efficiency issues, Lighthouse provides centralized provisioning, a reliable source of truth, and scalability.

Lighthouse (LH) is available in Enterprise and Automation Edition.

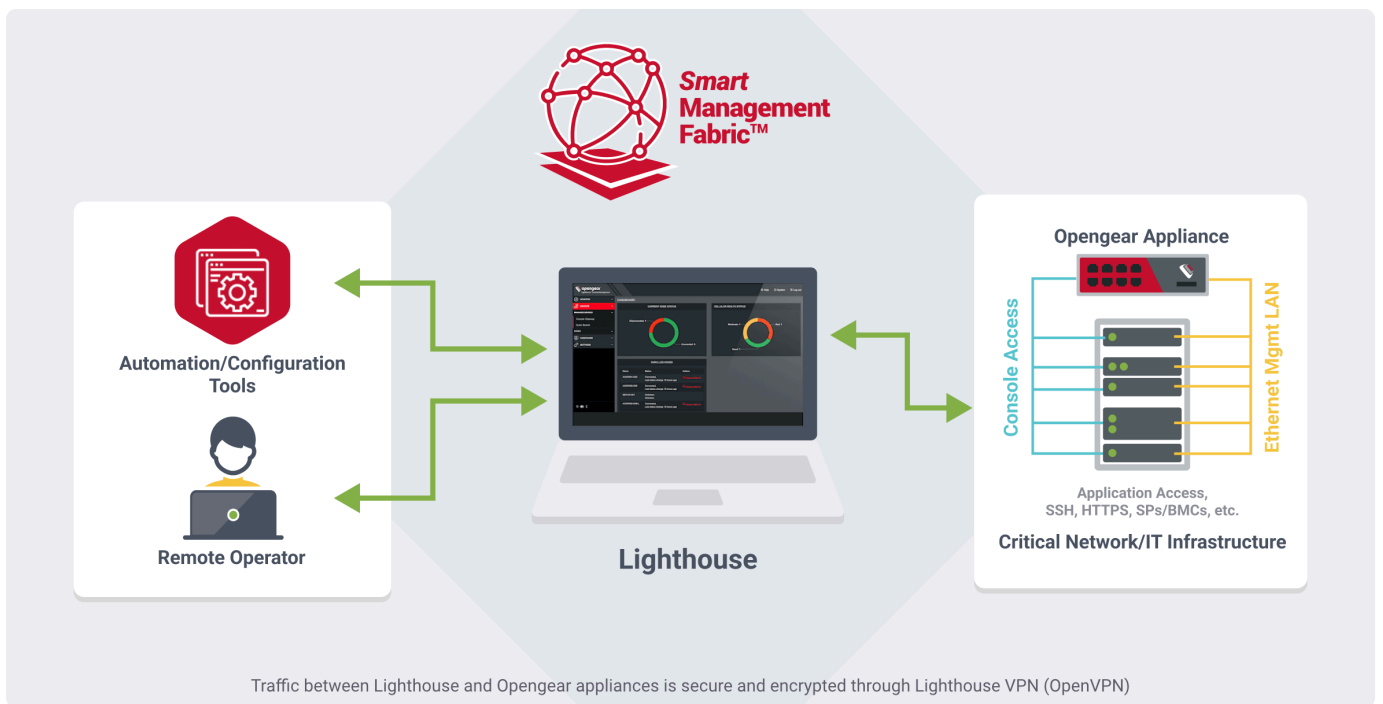

Lighthouse Enterprise

- Multi-instance capability provides redundancy and resiliency for evolving networks.
- Provides presence and proximity to critical devices, enabling network professionals to access, deploy, and manage their network devices.

Lighthouse Enterprise: Automation Edition (AE)

- LH Ent. AE includes all the features of LH Enterprise and is further enhanced with Smart Management Fabric (SMF), providing dynamic routing-based access to IP endpoints.
- Assists network professionals, system administrators, and IT support teams by saving time and effort.

Benefits

Simplified deployment

Enroll, remove, and streamline the configuration of your connected physical and virtual resources securely.

Deploying and configuring devices can be time-consuming and prone to human errors. Save time and money with remote configuration. Instead of scheduling 3rd party resources to configure your Opengear appliances, use Lighthouse.

Streamlined management

Become the “source of truth” for connected resources by provisioning them on day 0/1 and then tracking updates and changes.

Network professionals look for new ways to save time and avoid repetitive tasks when managing their network infrastructure assets. With Lighthouse, you can enable aggregation and reduce the time needed to perform administrative tasks.

Expedited access

Lighthouse is a resilient path for all your connected endpoints for quick access.

Spend more time on strategic projects or critical IT priorities. Access a device quickly and get on with your day when disruption occurs. As a secure access portal, Lighthouse delivers a complete view and access to your connected physical and virtual resources. Use Lighthouse to expedite access for audits, restoration, and operation management.

Features

	Lighthouse Enterprise Edition	Lighthouse Automation Edition
Benefits		
Scalability	✓	✓
Multi-Instance	✓	✓
Enterprise Grade Security	✓	✓
3rd Party Integrations	✓	✓
Dynamic routing based IP-access	-	✓
Secure streamlined deployments	-	✓
Machine-to-machine & User-to-machine connectivity	-	✓
